Pressure
Pressure is defined as the force per unit area. The pressure $P$ under a column of liquid can be calculated from the following law:

$$P = \rho \, g \, h$$

Where the:
- $\rho$ is the density of the liquid
- $g$ is the acceleration due to the gravity
- $h$ is the height of the column
Ex:- what height of water will be produced the same pressure as 120 mmHg.

Solution: \[ P = \rho g h = 13.6 \times 980 \times 12 \]
\[ = 1.6 \times 10^5 \text{ dy/cm}^2 \]

For water \[ P = \rho g h \]
\[ 1.6 \times 10^5 = 1 \times 980 \times h \]
So \[ h = 163 \text{ cm H}_2\text{O} \]

Or \[ P_{\text{Hg}} = P_{\text{H}_2\text{O}} \]
\[ (\rho g h)_{\text{Hg}} = (\rho g h)_{\text{H}_2\text{O}} \]
\[ \rho_{\text{Hg}} h_{\text{Hg}} = \rho_{\text{H}_2\text{O}} h_{\text{H}_2\text{O}} \]
\[ h_{\text{H}_2\text{O}} = \frac{(13.6 \times 12)}{1} = 163 \text{ cmH}_2\text{O} \]
Ex:- Calculate the atmospheric pressure in N/m$^2$

Solution:- 1 atm =760 mmHg =76 cmHg

The atmospheric pressure in N/m$^2$ is equal

\[ P = \rho gh = 13600 \text{kg/m}^3 \times 9.8 \text{m/s}^2 \times 0.76 \text{m} \]

\[ = 1.01 \times 10^5 \text{ N/m}^2 \]
Gauge Pressure

The excess pressure over atmospheric pressure.
Negative Pressure

- Any pressure lower than atmospheric pressure. For example: The lung pressure during inspiration is a few centimeter of water negative, a person drink through a straw the pressure in his mouth must be negative.

- There are numbers of places in the body where the pressure is lower than atmospheric pressure or negative. For example when we breath inspire the pressure in the lungs must be lower than the atmospheric pressure.
The most common clinical instrument used in the measuring pressure is the sphygmomanometer, which measures blood pressure.
# Typical pressure in the normal body

Measurement of pressure in the body
An instrument that measures pressure is called a manometer. The common clinical instrument used in measuring pressure is the sphygmomanometer. Two types of pressure gauges are used in sphygmomanometer, they are
Pressure inside the skull

- The brain contains approximately 150 cm$^3$ of cerebral spinal fluid (CSF) in a series of interconnected openings called ventricles.
CSF (brain)----to ventricles-----to spinal column-----to circulatory system.

One of the ventricles, the aqueduct is especially narrow.

-If at birth this opening is blocked for any reason, the CSF is trapped inside the skull and increases the internal pressure. The increased pressure causes the skull to enlarge. This serious condition is called hydrocephalus.
Measuring the CSF pressure

It is not convenient to measure the SCF pressure directly. There are two methods:

1-Crude method: This method can measure the pressure inside the skull by measuring the circumference of the skull just above the ears. Normal values for newborn infants are from (32-37) cm, and a larger value may indicate hydrocephalus.
2-Transillumination: is a qualitative method of detection. Make use of the light-scattering properties of the rather clear CSF inside the skull.

A bright light is shined through a body cavity or organ such as the brain.
Eye pressure

- Normal Eye
- Eye with Glaucoma

- Build Up of Aqueous Humor Fluid
- Damage to the optic nerve
- Trabecular Meshwork

PRESSURE
The clear fluids in the eye ball (aqueous and vitreous humors) that transmit the light to the retina (the light sensitive part of the eye), are under pressure and maintain the eye ball in a fixed size and shape.

- If a partial blockage of the drain system occurs, the pressure increase of restrict the blood supply to the retina then affect the vision. This condition, called glaucoma.

Glaucoma:
1- moderate----------tunnel vision
2- severe--------------blindness

- The pressure in normal eyes ranges from (12 - 23) mmHg.
Measuring the eye pressure

1-By feel the physicians estimate the pressure inside the eye by feel as they pressed on the eye with their fingertips.

2-By the tonometer
An instrument is used to measure intraocular pressure (IOP).
Pressure in the Digestive System
- Opening through the body
- Over 6 m
- Closed in the lower end and has several restrictions
- Valves and sphincters permit unidirectional flow of food.
Pressure in the gastrointestinal (GI) system
- Greater than atmospheric pressure in most parts
Esophagus pressure is usually less than atmospheric pressure

Pressure in the stomach

A. Eating increases the pressure in the stomach slowly due to increased volume
B. Air swallowed during eating increases the pressure in the stomach → burping or belching

Pressure in the gut

A. Bacteria action generates gas (flatus) → increase gut pressure
B- Belts, girdles, or swimming → affect gut pressure
Pylorus : valve
-Prevents the flow of food back into the stomach from the small intestine
-blockage in the small or large intestine → high pressure between the blockage and the pylorus → blockage of blood flow to critical organs → death
-Treatment
  A-Intubation: a hollow tube though the nose, stomach, and pylorus
  B-Surgery in a pressure-controlled operating room
- The highest pressures in the body are found in the weight bearing bone (joints).

- The pressure in the knee joint may be more than 10 atm \( P = \frac{F}{A} \) \(^{(1)}\)

- The surface area of a bone at the joint is greater than its area either above or below the joint. The larger area at the joint distributes the force, thus reducing the pressure, according to equation (1).

- Bone has adapted in another way to reduce pressure, the finger bones are flat rather force is spread over a larger surface, this reducing the tissues over the bones according to \( P = \frac{F}{A} \).
Pressure in the urinary bladder

- The interval pressure in the bladder is due to the accumulation of urine. The figure below shows the typical pressure-volume curves for the bladder, which stretches as the volume increase.
- For adult, the typical max. Volume in the bladder before voiding is 500ml. At some pressure nearly 30cmH2o the micturition reflex occurs.
- The resulting sizable muscular contraction in the bladder wall produces a momentary pressure of up to 150cmH2O.
The pressure in the bladder can be measured:
1-By passing a catheter with a pressure sensor into the bladder through the urinary passage (urethra).
2-By a needle inserted through the wall of the abdomen directly into the bladder. This technique gives information about the function of the exit valves that cannot be obtained with the catheter technique.
-The bladder pressure increases during coughing, straining, sitting up, also during pregnancy the weight of fetus over the bladder increase the bladder pressure and causes frequent urination.
Normal voiding pressure is fairly low (20 - 40) cmH2o but for men who suffer from prostate obstruction of the urinary passage it may be over 100 cmH2o
Pressure effects while diving

- The body is composed primarily of solids and liquids, which are nearly incompressible. Pressure changes do not greatly affect most of it. However, there are gas cavities in the body where sudden pressure changes can produce profound effects.
Boyles law

For a fixed quantity of gas a fixed temperature the product of the absolute and volume is constant.

\[ PV = \text{constant} \]

\[ P_1 V_1 = P_2 V_2 = \text{constant} \]

That is, if the absolute pressure is doubled, the volume is halved.
The middle ear is one of the air cavities that exist within the body. For comfort, the pressure in the middle ear should be equal to the pressure on the outside of the eardrum:

\[ P_{\text{middle ear}} = P_{\text{outside eardrum}} \]
This equalized is produced by air flowing through the Eustachian tube, which is usually closed except during swallowing, chewing, and yawning.

- When diving many people has difficulty obtaining pressure equalization and feels pressure on their ears.
-(120mmHg) across the eardrum, which can occur in about 1.7 m of water, can cause damage (rupture) to the eardrum. One method of equalization used by divers is to raise the pressure in the mouth by holding the nose and trying to blow
The pressure in the lung

Pressure in the lung at any depth greater than the pressure in the lung at sea level. This means that the air in the lung is denser under water and that the partial pressure of all the air components are proportionately higher.
1-The higher partial pressure of O\textsubscript{2} causes more O\textsubscript{2} molecules to be transformed into the blood, and oxygen poisoning results if the partial pressure of the O\textsubscript{2} gets high. Partial pressure of O\textsubscript{2} is 0.8 atm and absolute air pressure is 4 atm at depth of 30m.
2-Breathing air at a depth of 30m is also dangerous because it may result in excess N\textsubscript{2} in the blood and tissues, there is a possibility of having:

- Nitrogen narcosis (intoxication effect)
- The bends or decompression sickness (a scant problem).

O\textsubscript{2} is attached to red blood cells, while N\textsubscript{2} is dissolved in the blood and tissues.
Henrys law
The amount of gas that will dissolve in a liquid is proportional to the partial pressure of the gas in contact with the liquid.
Hyperbaric oxygen therapy (HOT)

The body normally lives in an atmosphere that is about one fifth $O_2$ and four-fifth $N_2$. In some medical situations it is beneficial to increase the proportion of $O_2$ in order to provide more $O_2$ to the tissue.
1-Gas gangrene:
The bacillus causes gas gangrene then it's treated with (HOT). That is due to bacillus cannot survive in the presence of oxygen.

2-Carbon monoxide poisoning:
-The red blood cells cannot carry $O_2$ to the tissues because the carbon monoxide fasters to the hemoglobin at the places normally used by $O_2$.

-Normally the amount of $O_2$ dissolved in the blood is about 2% of that carried on the red blood cells.
-By using the (HOT) technique, the partial pressure of O₂ can be increased by a factor of 15, permitting enough O₂ to be dissolved to fill the body's needs.
3-Treatment of cancer: (HOT) with radiation is given to the patient in transparent plastic tank. The theory was that more oxygen would make the poorly oxygenated radiation-resistant cell in the center of the tumor more susceptible to radiation damage.
